Can a battery energy storage system complement a PV plant in Mexico? An analysis was carried out to verify if it would be commercially feasible to operate a Battery Energy Storage System (BESS) to complement the operation of a PV plant in the Mexican market. This PV plant would generate a revenue through the contracting via the , or LTAs in Mexico. Is electrical energy storage system use case a source of revenue? An Electrical Energy Storage System use case for the capacity component only exists if a capacity component was awarded in the auctions. Therefore, no revenue can be generated from the results of the auctions due to a lack of awarded capacity bids. However, capacity is a possible source of revenue from the and auctions. How much does a power plant cost per MW? This value is in line with typical market conditions worldwide, where the contracted operation of such services is typically between 150,000 USD and 400,000 USD (3 to 8 million MXN) per MW and year. Why do we need energy storage? The current main driver for the need for energy storage is the fact that renewable energies in general, and particularly photovoltaic and wind power plants (variable Renewable Energies - vRE), are increasingly entering the electricity market whilst displacing conventional technologies. Can energy storage systems be re-used? As most energy storage systems are coupled through inverters, most best practices from PV and wind power plants can be re-used. Care has to be taken since EESS differ from PV and wind power plants since they do not only export energy, but import energy as well. How much power does a battery energy storage system use? A typical Battery Energy Storage Systems in standby only consumes between 0.5 - 2% of its nominal power (e.g., a BESS with a nominal power of 1 MW would have an average auxiliary power consumption of 5 kW - 20 kW) and can be started from the "cold" offline state to the "hot" running state within 5 seconds or less. Discover electricity costs in Mexico, how CFE rates affect your bill, and the best strategies for reducing energy expenditure. Unlike other rate systems, Mexico applies pricing structures that include hourly and seasonal rates, designed to more accurately reflect the variable costs associated with the generation, distribution, and transmission of electricity. In addition, Mexico has a differentiated tariff structure that The regulatory landscape for energy storage in Mexico is still evolving, with a lack of clear and consistent regulations causing uncertainty for investors and developers. While supportive policies exist, access to financing remains a hurdle for many projects, particularly smaller-scale Average electricity prices for enterprises in Mexico from December to September (in U.S. dollar cents per kilowatt-hour) [Graph].
