Which energy storage technologies are included in the cost and performance assessment?The Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage. Are battery storage costs based on long-term planning models?Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs. What are energy storage technologies?Informing the viable application of electricity storage technologies, including batteries and pumped hydro storage, with the latest data and analysis on costs and performance. Energy storage technologies, store energy either as electricity or heat/cold, so it can be used at a later time. Are battery electricity storage systems a good investment?This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By , total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials. What happened to battery energy storage systems in Germany?Small-scale lithium-ion residential battery systems in the German market suggest that between and , battery energy storage systems (BESS) prices fell by 71%, to USD 776/kWh. What is the energy storage Grand Challenge?The U.S. Department of Energy's (DOE) Energy Storage Grand Challenge is a comprehensive program that seeks to accelerate the development, commercialization, and utilization of next-generation energy storage technologies. Dramatic and ongoing reductions in the cost of solar energy and battery storage combined with copious sunlight for seven months of the year suggest that solar and storage could play an important role in reducing costsand dependence on fossil fuels in Greenland and elsewhere in the far north. Dramatic and ongoing reductions in the cost of solar energy and battery storage combined with copious sunlight for seven months of the year suggest that solar and storage could play an important role in reducing costsand dependence on fossil fuels in Greenland and elsewhere in the far north. Figure ES-2 shows the overall capital cost for a 4-hour battery system based on those projections, with storage costs of \$245/kWh, \$326/kWh, and \$403/kWh in and \$159/kWh, \$226/kWh, and \$348/kWh in .
