

## average hybrid renewable storage price per 1GW in Canada

What types of energy storage are available in Canada? There are three main types of energy storage currently commercially available in Canada: Storage is playing an increasingly important role in the electricity system by improving grid reliability and power quality, and by complementing variable renewable energy sources (VRES) like wind and solar. How much energy storage does Canada need? Image: NRStor. Energy Storage Canada's report, Energy Storage: A Key Net Zero Pathway in Canada indicates Canada will need a minimum of 8 to 12GW of energy storage to ensure Canada achieves its goals. What is the fastest growing energy storage technology in Canada? BESS is the fastest growing energy storage technology in Canada and is also the dominant storage technology in terms of capacity and number of sites. All but four projects proposed to be commissioned by are battery storage, with two CAES and two PHS projects also proposed. Should energy storage be a key component of Canada's energy future? Long-duration storage should be a key component of Canada's energy future. Additionally, while it is important we act and act quickly to deploy energy storage to meet the evolving needs of Canada's energy system, we also need to act with an eye toward the long-term beyond. Do hybrid energy resources provide value to integrated electrical systems? While hybrid resources (e.g. wind-storage and solar-storage combinations) may allow for greater flexibility compared to stand alone renewables or storage, the value they may provide to an integrated electrical system, beyond that of the sum of value provided by their underlying components, is not clear. What is a resource cost forecast (ATB)? The ATB is an annual survey of resource cost projections that is a common reference point for both industry and academic studies. The cost forecasts used in this module are updated from the values that were used in the IESO's P2D study and are based on the NREL ATB report. The analysis focuses on developing a single scenario for cost trajectories based on the various available data from literature, however several global and local uncertainties exist around future technology and financial factors that could impact the cost of renewable deployments in Canada. The analysis focuses on developing a single scenario for cost trajectories based on the various available data from literature, however several global and local uncertainties exist around future technology and financial factors that could impact the cost of renewable deployments in Canada. Levelized Cost of Natural Gas is \$3.771 per MMBtu. Fuel Cost Projections are from the IESO APO. Carbon Tax is assumed to increase by \$15/ton from \$65/ton to \$170 by and stay constant. For project costs, we assume the tax is levelized over the project life. Detailed assumptions are While hybrid resources (e.g. wind-storage and solar-storage combinations) may allow for greater flexibility compared to stand alone renewables or storage, the value they may provide to an integrated electrical system, beyond that of the sum of value provided by their underlying components, is not Most recently, the Federal Budget built upon the 30% Clean Technology Investment Tax Credit (ITC) announced in November's Fall Economic Statement, with the introduction of a 30% Clean Technology Manufacturing Credit and a 15% Clean Electricity ITC, which expands eligibility to non-taxable The installed capacity of energy storage larger than 1 MW--and connected to the grid--in Canada may increase from 552 MW at the end of to 1,149 MW in , based solely on 12 projects currently

under construction 1. There are an additional 27 projects with regulatory approval proposed to come All scenarios examined in this analysis result in significant levels of storage by mid-century consistent with the capabilities of widely deployed lithium-ion batteries (~4 hours). The benefit of this type of battery is their ability to shift wind and solar generation on an intra-day basis at They can be combined in the same location ("co-located deployment"), or even integrated into a single hybrid project. This is happening at multiple scales. For example, many building owners are investing in rooftop solar PV generation systems, paired with batteries, so that power generated from the Cost of Renewable Generation in CanadaThe analysis focuses on developing a single scenario for cost trajectories based on the various available data from literature, however several global and local uncertainties exist around Annual Planning Outlook: Resource Costs and TrendsFor battery storage, as more is added to the grid, it flattens the demand curve and spreads out the hours of the day when there is a need on the system, and as a result, the UCAP% of battery Microgrid hybrid renewable energy systems with hydrogen and This study aims to assess the feasibility of implementing microgrid hybrid renewable energy systems incorporating green hydrogen production and storage, alongside A snapshot of Canada's energy storage market in The result is a sense of powerful momentum building within the sector to accelerate the development and deployment of energy storage, particularly within the context Market Snapshot: Energy storage in Canada may multiply by The size of the marker indicates the magnitude of the project. This figure illustrates the geographic distribution and diversity of energy storage projects across Canada, A study on the energy storage market in CanadaWhile electricity price increases are anticipated in most provinces from -, results suggest that the falling cost of wind and solar alongside energy storage could drive down the Hybrid Renewable Energy Synergies between wind, solar and energy-storage technologies are driving changes on the ground across Canada. There is rapidly growing interest in the joint deployment of these technologies. Canada GES2024 Canada's renewable energy sector grew by 11% in , with wind and solar together adding 2GW in generation capacity. In the process, the industry added 140MW in total energy storage Grid Energy Storage Technology Cost and The Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries,
