

## hybrid solar storage cost vs benefit calculation in Burundi

Why are hybrid energy systems more expensive than single-source systems? Hybrid systems may have higher initial investment costs compared to single-source systems. The variability of renewable energy can affect the predictability of returns on investment. Some technologies in HRES might not be mature, leading to economic uncertainties. How can a hybrid energy system improve grid stability? By incorporating hybrid systems with energy storage capabilities, these fluctuations can be better managed, and surplus energy can be injected into the grid during peak demand periods. This not only enhances grid stability but also reduces grid congestion, enabling a smoother integration of renewable energy into existing energy infrastructures. How can a hybrid energy storage system help a power grid? The intermittent nature of standalone renewable sources can strain existing power grids, causing frequency and voltage fluctuations. By incorporating hybrid systems with energy storage capabilities, these fluctuations can be better managed, and surplus energy can be injected into the grid during peak demand periods. Are hybrid energy systems cost-effective? Shared infrastructure in hybrids results in cost-effectiveness. Research, investment, and policy pivotal for future energy demands. The review comprehensively examines hybrid renewable energy systems that combine solar and wind energy technologies, focusing on their current challenges, opportunities, and policy implications. What are the benefits of hybrid energy systems? Hybrid systems contribute to grid stability: the intermittent nature of some renewable sources can strain power grids. Hybrid systems equipped with energy storage can act as grid stabilizers by supplying power during peak demand times, reducing grid congestion and enhancing overall stability. Hybridization aids remote and off-grid areas. Are hybrid energy systems economically viable? Economic viability, including initial setup costs and ongoing maintenance expenses, needs to be evaluated in the context of long-term benefits. Moreover, policy frameworks and regulations should be formulated to incentivize the adoption of hybrid systems and ensure a seamless transition towards cleaner energy. In conclusion, based on the assumptions in this Model Business Case, the hybrid solar-SHP mini-grid Project is estimated to be attractive with an after-tax EIRR of 17% and 16.5%, when financed with EUR debt and BIF debt, respectively.
